2.75"

One to Four 350  $\Omega$  Sensors, 0-5 mV to 0-1200 mV, 4-10 VDC Excitation

Output: 0-1 V to ±10 V or 0-1 mA to 4-20 mA, Non-Isolated

- Drive up to Four 350  $\Omega$  Bridges
- Adjustable Excitation Power Supply
- One Minute Setup for Hundreds of I/O Ranges
- Easy-to-use External Switches for Setup
- Hot-Swappable Plug-In Design
- Input and Output LoopTracker® LEDs
- Adjustable Output Test
- Internal Calibration Resistor Option

- Load Cell Weighing Systems and Scales
- Strain Gauge Pressure Sensors and Transducers
- Tanks, Scales, Extruder Melt Pressure, Crane Loads

#### Strain Gauge Input Ranges

Minimum range: 0 to 5 mV  $\,$ 0 to 1200 mV Maximum range: Minimum sensitivity: 0.5 mV/V Maximum sensitivity: 120 mV/V

Millivolt output range is determined by the sensitivity of the sensor (mV/V) and the excitation voltage applied.

mV/V sensitivity X excitation voltage = total mV range

#### Input Impedance

1 M $\Omega$  typical

# **Common Mode Rejection**

100 dB minimum

#### **Calibration Resistor Option**

Toggle switch for internal shunt resistor M01 option:

## **Excitation Voltage**

Maximum output: 10 VDC maximum at 115 mA Drive capability: Up to four 350  $\Omega$  bridges at 10 VDC Switch-selectable: 0-10 VDC in 1 V increments ±2.5% via multi-turn potentiometer Fine adjustment: ±0.01% per °C Stability:

#### LoopTracker

Variable brightness LEDs for input/output loop level and status

#### **DC Output Ranges**

Voltage: 0-1 VDC to 0-10 VDC Bipolar voltage: ±10 VDC ±1 VDC to 0-2 mADC to 0-25 mADC Current: 20 V compliance, 1000  $\Omega$  at 20 mA

# **Output Calibration**

Multi-turn zero and span potentiometers ±15% of span adjustment range typical

## Zero Offset

±100% of span in 15% increments

# **Output Ripple and Noise**

Less than 10 mVRMs ripple and noise

# **Output Test**

Sets output to test level when pressed Adjustable 0-100% of span Not available with M01 option

# **Accuracy**

±0.1% of span (includes adjustment resolution and linearity)

# Response Time

150 milliseconds typical (6.6 Hz)

DF option: 75 millisecond response time typical (13.3 Hz) Contact factory for faster response times

#### **Ambient Temperature Range and Stability**

-10°C to +60°C operating ambient Better than 0.04% of span per °C stability

# **Housing and Sockets**

IP 40, requires installation in panel or enclosure Plugs into API 011 or API 011 FS socket

Socket mounts to 35 mm DIN rail or can be surface mounted

11-Pin Socket

**Sold Separately** 

# Power

Standard: 115 VAC ±10%, 50/60 Hz, 2.5 W max. A230 option: 230 VAC ±10%, 50/60 Hz, 2.5 W max. P option: 85-265 VAC 50/60 Hz, 60-300 VDC, 2.5 W typ. D option: 9-30 VDC, 2.5 W typical

## Description

The API 4058 G accepts a strain gauge, bridge, load cell, or a summed input from up to four sensors, and provides a proportional, non-isolated DC voltage or current output. It includes filtering and processing to allow effective use of lowlevel transducers in the noisy environments found in industrial

The built-in 115 mA bridge excitation power supply generates a stable source of excitation voltage to drive from one to four 350  $\Omega$  (or greater) bridge type sensors such as load cells, pressure transducers and strain gauges The API 4058 G amplifies and converts the resulting millivolt signal into the selected output.

Input, output, excitation, and zero offset are field configurable, via external rotary and slide switches. Common ranges are on the module label. An offset switch is standard for applications requiring cancellation of sensor offsets or non-zero deadweights (taring). Zero and span potentiometers allow calibration of the output.

# LoopTracker

API exclusive features include two LoopTracker LEDs (green for input, red for output) that vary in intensity with changes in the process input and output signals. These provide a quick visual picture of your process loop at all times and can greatly aid in saving time during initial startup and/or troubleshooting.

Hot Swappable

Plug-In Design

#### **Output Test**

An API exclusive feature includes the test button to provide a fixed output (independent of the input) when held depressed. The test output level is potentiometer adjustable from 0 to 100% of output span. The output test button greatly aids in saving time during initial startup and/or troubleshooting.

The output test is not available with the M01 option. A calibration resistor switch replaces the test button.

#### Mounting

The API 4058 G plugs into an industry standard 11-pin octal socket sold separately. Sockets API 011 and finger-safe API 011 FS allow either DIN rail or panel mounting.

Model	Input	Output	Power	
API 4058 G	Field fierwell fr \( \alpha \) \( \alpha \)		115 VAC

#### **Precautions**

WARNING! All wiring must be performed by a qualified electrician or instrumentation engineer. See diagram for terminal designations and wiring examples. Consult factory for assistance.

WARNING! Avoid shock hazards! Turn signal input, output, and power off before connecting or disconnecting wiring, or removing or installing module.

#### **Précautions**

ATTENTION! Tout le câblage doit être effectué par un électricien ou ingénieur en instrumentation qualifié. Voir le diagramme pour désignations des bornes et des exemples de câblage. Consulter l'usine pour assistance.

ATTENTION! Éviter les risques de choc! Fermez le signal d'entrée, le signal de sortie et l'alimentation électrique avant de connecter ou de déconnecter le câblage, ou de retirer ou d'installer le module.

#### **Excitation Voltage and Range Selection**

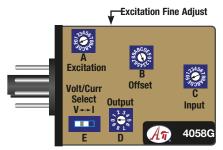

It is be easier to set excitation voltage, input, and output switches before installation. Common ranges are listed on the module label.

- See table below and set Excitation rotary switch A to the desired voltage. The excitation voltage should match the sensor manufacturer's recommendations
- 2. From the table at right, find the switch combination that matches

<b>Excitation</b>											
Switch A	Α	9	8	7	6	5	4	3	2	1	0

your input/output range and set rotary switches B, C, and D.

3. Set the Volt/Curr Select slide switch **E** to V for voltage or I for current, depending on the output type.

# Socket and Mounting

The module installation requires a protective panel or enclosure. Use API 011 or finger-safe API 011 FS socket.

The socket clips to a standard 35 mm DIN rail or can be attached to a flat surface using the two mounting holes.

## Input Terminals

Refer to wiring diagram and strain gauge manufacturer's data sheet for wiring and color coding. Polarity must be observed when connecting inputs. Connect up to 4 strain gauges or load cells. Sensor shield wire (if equipped) should be grounded at one end only.

#### **Excitation Voltage Connection**

Polarity must be observed. Never short the excitation leads together. This will cause internal damage to the module.

#### Signal Output Terminals

Polarity must be observed when connecting the signal output. Current output provides power to the output loop (sourcing).

#### Module Power Terminals

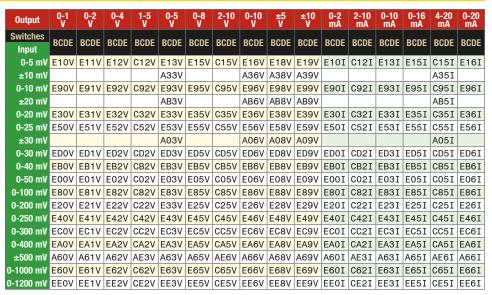

The module operating voltage shown on the model/serial number label must match available power. AC power can be connected with either polarity. Polarity MUST be observed for DC powered modules.

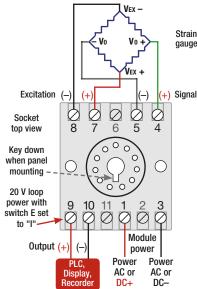

#### Calibration

Top-mounted Zero and Span potentiometers are used to fine-tune the output signal. An excitation voltage fine adjust potentiometer is located on the side of the module.

This procedure and does not account for offsets or tare weight calibration. To achieve optimum results, it is recommended that the API 4058 G be calibrated using an accurate bridge simulator before being placed in service.

- Apply power to the module and allow a minimum 20 minute warm up time.
- Measure the voltage across terminals 7 and 8 and adjust the excitation voltage fine adjust potentiometer for the exact voltage desired.
- 3. Provide an input to the module equal to zero or the minimum input required for the application.
- 4. Using an accurate measurement device for the module output, adjust the Zero potentiometer for the exact minimum output desired. The Zero control should only be adjusted when the input signal is at its minimum. This will produce the corresponding minimum output signal.

- 5a. Span calibration for standard models.
  - Set the input at maximum, and then adjust the Span potentiometer for the exact maximum output desired. The Span control should only be adjusted when the input signal is at its maximum. This will produce the corresponding maximum output signal.
- 5b. Span calibration with M01 option only

The M01 option uses a shunt resistor installed internally in the API 4058 G per customer specifications. The resistance is specified by the transducer manufacturer. Before starting calibration, ensure that the correct resistance value was specified.

The sensor manufacturer should provide the percentage of full-scale output for the transducer when using the internal resistor for calibration (typically 80%).

- Set the Test toggle switch to the Test position. The internal shunt resistor is switched into the circuit to unbalance the bridge.
- ii. Adjust the Span pot for an 80% full-scale output or 80% reading on the process indicator.
- Return the TEST switch to the opposite position and readjust the zero pot if necessary.
- The calibration procedure should be repeated several times to achieve the desired accuracy over the selected range.

# Using Offset Switch B

Offset switch B allows canceling of sensor offsets such as:

Tare weights or scale deadweight

Compensate for low-output sensors that may have large zero offsets. Switch B can realign the zero control so it has enough range to produce the desired zero output.

Raising the offset to allow calibration of bipolar sensors.

Lowering the offset to compensate for elevated input ranges.

- Switch B does not interact with any other switch and is the only switch needed to correct zero offsets. Its only purpose is to adjust or cancel effects of the low end of the input range not corresponding nominally to 0 mV. Setting this switch to "E" results in no offset.
- To RAISE the output zero, rotate switch B from "E" thru "A", until the Zero control can be set for your application.
- To LOWER the output zero, rotate switch B from "E" thru "9", until the Zero control can be set for your application.
- 4. After all switches are set, repeat the calibration procedure.

#### **Output Test Function**

Note that models with the M01 option do not have a TEST function. With this option the Test switch operates the calibration resistor and the Test Cal. potentiometer is non-functional.

The output test potentiometer is factory set to provide approximately 50% output. When the test button is depressed it will drive the output with a known good signal that can be used as a diagnostic aid during initial start-up or troubleshooting. When released, the output will return to normal.

The Test Cal. potentiometer can be used to set the test output to the desired level. It is adjustable from 0 to 100% of the output span. Press and hold the Test button and adjust the Test Cal. potentiometer for the desired output level.

# Operation

Strain gauges and load cells are normally passive devices that are commonly referred to as bridges due to their four-resistor Wheatstone bridge configuration. These sensors require a precise excitation source to produce an output that is directly proportional to the load, pressure, etc. that is applied to the sensor.

The exact output of the sensor (measured in millivolts) is determined by the sensitivity of the sensor (mV/V) and the excitation voltage applied. For example, a load cell rated for 3 mV/V sensitivity and 10 VDC excitation will produce an output of 0 to 30 mV for load variations from 0 to 100%.

#### 3 mV/V sensitivity X 10 VDC excitation = 30 mV range

The API 4058 G provides a precise excitation voltage to the sensors and receives the resulting millivolt signal in return. This input signal is filtered and amplified, then offset, if required, and passed to the output stage. Depending on the output configuration selected, a DC voltage or current output is generated.

**GREEN LoopTracker® Input LED** – Provides a visual indication that a signal is being sensed by the input circuitry of the module. It also indicates the input signal level by changing in intensity as the process changes from minimum to maximum. If the LED fails to illuminate, or fails to change in intensity as the process changes, this may indicate a problem with module power or signal input wiring.

RED LoopTracker Output LED — Provides a visual indication that the output signal is functioning. It becomes brighter as the input and the corresponding output change from minimum to maximum. For current outputs, the RED LED will only light if the output loop current path is complete. For either current or voltage outputs, failure to illuminate or a failure to change in intensity as the process changes may indicate a problem with the module power or signal output wiring.

API maintains a constant effort to upgrade and improve its products. Specifications are subject to change without notice. Contact factory for assistance and see api-usa.com for latest datasheet version.
